

ABSTRACT

An apparatus may be used to dispense a plurality of automotive appearance care products. The apparatus may include a plurality of storage containers. Mixing systems may be coupled to the storage containers. The mixing systems may combine raw materials with a carrier fluid to produce product fluids. The product fluids may be stored in storage vessels. A plurality of pumps may be used to produce a flow of one or more product fluids. The product fluids may be dispensed through one or more dispensing conduits. In certain embodiments, the apparatus may dispense an amount of product fluids sufficient to treat a selected amount of automobiles before at least one storage container becomes substantially empty. In certain embodiments, the apparatus may produce a minimum amount of at least one product fluid before at least one storage container becomes substantially empty.
